No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Am. J. Physiol. 279:R222-R229(2000).
-!- FUNCTION: This is the non-catalytic component of the active enzyme, which catalyzes the hydrolysis of ATP coupled with the exchange of Na (+) and K(+) ions across the plassma membrane.
-!- SUBUNIT: Composed of three subunits: alpha (catalytic), beta and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-0CT-2000 (TrEMBLrel. 15, Created)

R. Crawley M.J., Cowen R.S.;

C. Submitted (SEP-2003) to the EMBL/GenBank/DDBJ databases.

C. Tibulose 1.5-bighhosphate, the primary event in photosynthetic carbon dioxide fixation, as well as the oxidative fragmentation of the pentose substrate in the photorespiration process. Both cactions occur simultaneously and in competition at the same active site (By similarity).

C. CATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate + CO(2) + H(2)O = ATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate + CO(2) = 3-bigphospho-D-glycarate + 2-phosphoglycolate.

C. CATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate + CO(2) = 3-bigphospho-D-glycarate - 2-phosphoglycolate.

C. CATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate + CO(2) = 3-bigphosphate D-glycarate - 2-phosphoglycolate.

C. CATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate + CO(2) = 3-bigphosphate D-glycarate - 2-phosphoglycolate.

C. CATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate + CO(2) = 3-bigphosphate (By similarity).

C. CATALYTIC ACTIVITY: D-ribulose 1,5-bigphosphate carboxylase activity; IEA.

DR GO: GO:0005637; C:ribulose bisphosphate carboxylase activity; IEA.

GO: GO:0016894; F:ribulose-bisphosphate carboxylase activity; IEA

The invention relates to a human monoclonal antibody or its antigen binding fragments, which exhibit immunological binding affinity for a hepatitis C virus (HCV) El antigen, comprising an amino acid sequence homologous to the binding portion of a human antibody Fab molecule from combinatorial antibody library. The vaccine composition comprising the antibodies or antigen binding fragments against HCV El or E2 antigen or its hypervariable region is useful in treating or preventing HCV infection in a subject. Sequences AGG76513-ABG76568 represent human monoclonal antibodies against HCV El antigen

New molecular conjugate having a monoclonal antibody that binds to human APCs linked to a beta human chorionic gonadotropin, useful for inducing a

The present invention describes a molecular conjugate comprising a monoclonal antibody that binds to human antigen presenting cells (APCE) inved to beta human chorionic gonadoropin (Betahco), where the antibody comprises a heavy and/or light chain variable region derived from a human comprises a heavy and/or light chain variable region derived from a human comprises a heavy and/or light chain variable region derived from a human comprise a heavy and/or light chain variable region derived from a human comprise of SEQ ID NO:30 or 32 (ADR46847, or ADR46849), respectively. Also described: (1) a molecular conjugate comprising a human antibody heavy conjugate comprises the tall amno acid sequence of SEQ ID NO:12 (human antibody that binds to human APCs linked to betahcd, where the conjugate comprises the tall amno acid sequence of SEQ ID NO:12 (human antibody that binds to human APCs linked to betahcd, where the conjugate comprises the tall amno acid sequence of SEQ ID NO:12 (as described above, and a carrier, optionally in combination with an adjuvant; (4) inducing or enhancing a T cell-mediated immune response, against the antigen; (5) immunising a subject comprising administering any of the molecular conjugates described above, with APCs such that the antigen; (5) immunising a subject comprising doministering any of the molecular conjugates described above, optionally in combination with an adjuvant, a cytokine which stimulates proliferation of dendritic cells and/or an immunostimulatory agent; and comprising forming a conjugate of the antigen and a monoclonal antibody which binds to APCs, and contacting the conjugates either in vivo or exvivo with APCs such that the antigen; and conjugate either in vivo or exvivo with APCs such that the antigen is internalised, processed and presented to T cells in a manner which induces or enhances a cytotoxic T cell response against the antigen. The molecular conjugate either in vivo cell response against the antigen is independent or cells in a manner which induces or enhances eliciting a potent antigen-specific cytotoxic T lymphocyte response, including melanoma, fibrosarcoma, leukaemia, HIV, heparlitis, malaria and herpes. The present sequence represents a human pBl1-betahCG molecular conjugate, which is used in the exemplification of the present invention. cytotoxic T cell response in cancers and infectious diseases 411 26 0 2 137 Length: Matches: Conservative: Mismatches: Indels: Claim 16; SEQ ID NO 12; 82pp; English 0.000163 113.30 15.76% 15.76% 76.55% Similarity: Sequence 411 AA; Percent Similarity: Best Local Similari Alignment Scores: Query Match:  $\texttt{H}^{\mathsf{X}}(\mathsf{X}^{\mathsf{X}}) \cup \mathsf{COO}(\mathsf$

sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte to detect or

their active domains. The polypectides, polymeterides and antibodies raised against the polypeptides, polymeterides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein mammal and prevention of disorders caused by the aberrant protein care used to activity. The polypetides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides or sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti-sense DNA or RNA and in generating the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein antibodies/elicit an immune response, to determine quantitative protein place is set issue markers, and to isolate receptors or ligands.

Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon,

This sequence is the consensus VH5 domain of an anti-CD4 antibody (Ab). This sequence can be used in the method of the invention for treating a subject, where the treatment comprises administration of an Ab. The method comprises the administration of an antibody which has an Old World monkey (e.g. babcon or macaque) variable region which binds to an antigen (Ag) (or Ag binding portion), and a human constant domain. The method is useful for the treatment of ecseme and immuno-modulated diseases and especially rheumatoid arthritis. The recombinant antibodies used are sufficiently different from native monkey antibodies to allow human antibodies used in therapy in prior art, these antibodies do not induce human anti-antibodies used in therapy in prior art, these antibodies do not induce human anti-antibodies on repeated administration. They also have longer half-lives and do not have a lack of effector function with human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Fv molecule; hypervariable region; single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia.

The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dGFv). The peptide, optionally in association with or attached, compled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an accute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; Fv molecule; hypervariable region; single chain Fv; cytostatic;

The invention relates to a peptide or polypeptide comprising an Fy molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single cannot very (serP) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Fv molecule, hypervariable region, single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                         The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is constructed by a first hypervariable region and Fv is a single chain Fv (scry) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an accomposition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region created peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          15 GlyGluSerLeuLyBIleSerCyBLyBGlySerGlyTyr-SerPheThrSerTyrTrpIl 34

```
The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune can seem to restencist, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to danage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases, cardiovascular diseases such as myocardial infarction, retinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-cells in interactions. This sequence represents a human antibody fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  15 GlyGluSerLeuLysIleSerCysLysGlySerGlyTyr-SerPheThrSerTyrTrpIl 34

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as call rolling, metaetasis and important in physiological phenomena such as call rolling, metaetasis and its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment or its complex comprising at least one antibody or its binding fragment or its complex comprising at least one can thook or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metaetasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases cardiovascular diseases such as myocardial infarction, cretinopathic diseases and other diseases mediated by abnormal platelet currents.
                                                                                                                  Human; antibody; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardiar infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plaksin D, Vogel T, Nimrod A, Mar-Haim H;

protein interact of the invention

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one attibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune complexes, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, cell-matrix, platelet-matrix, platelet-complexed tand/or cell-platelet adhesion or aggregation, for increasing complexed tand/or cell-platelet adhesion or aggregation, for increasing complexed cells to disease cells to decreasing the number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to decreasing the number of tumour or leukaemia cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as acancer, leukaemia, autoimmune diseases, inflammatory diseases cardiovascular diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-compathic diseases caused by sulphated tyrosine-dependent protein-compating calls. 47 54 Human; antibody; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction. immunoglobulin variable region. The first and second old World monkey can be the same or different. The recombinant antibody is useful for treating a human having the antigen described above, e.g. for treating cancer in a human having a tumour antigen, or for treating a human suffering from an autoimmune response (where the antigen is involved in an autoimmune response in the human). In particular, the recombinant antibody is useful for treating rheumatoid arthritis, eczema, or an immunomodulatory disease. The recombinant antibody is also useful for treating tumours, leukaemia, lymphoma, Hashimoto's thyroiditis, autoimmune carditis, anderility, autoimmune hemolytic anaemia, inflammatory bowel disease, sjognen's syndrome, psoriasis, or systemic lupus erythematosus. This is sponyapetide for creation of the recombinant antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying and obtaining inhibitor of a pathological process for treating e.g. autoimmunity comprises determining if a compound is capable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       47

The present invention describes a method for identifying and obtaining an inhibitor of a pathological process. The method comprises determining if a compound is capable of modulating the binding of the Rc-epsilon-R1 receptor alpha-chain and an autoantibody against the Rc-epsilon-R1 receptor alpha-chain for identifying and obtaining an inhibitor of a pathological process; (2) use of the identified inhibitor for inhibiting activity of the autoantibody against the Rc-epsilon-R1 receptor alpha-chain, and (3) a compound identified by the method, which binds but does not activate the autoantibody against the Rc-epsilon-R1 receptor alpha-chain. The method is useful for obtaining an inhibitor of a pathological process e.g. imbalance between cell-bound and finibitor of a pathological process e.g. imbalance between cell-bound and free IgE e.g. allergic disease (urticaria, late phase allergic reactions, intrinsic astema, drug intolerance and food intolerance). IgE mediated disease or malignancy. The compound is useful for treating a pathological process, particularly conditional autoimmunity. The present sequence
  modulating the binding of the Fc-epsilon-R1 receptor and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 heavy chain protein sequence from the present invention
                            autoantibody against its alpha-chain.
                                                                             Claim 20; Page 22; 29pp; English.

```
The invention relates to a novel method for the construction of a library of recombinant antibodies. The novel method comprises clustering variable regions of a collection of antibodies having known 3D structures into at least two families of structural ensembles, each comprising at least two different antibody sequences but with substantially identical main chain conformations. The method is useful for constructing a library of artificial antibodies in silico which provides a structurally diverse and yet functionally more relevant source of antibody candidates which can then be screened for binding a wide variety of target molecules, including small molecules, and biomacromolecules such as proteins,
                                                                                    Constructing a library of recombinant antibodies useful as source of antibody candidates for screening antigens comprises clustering variable regions of antibodies having known 3-dimensional structures into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        source of antibody candidates for further screening for novel antibodies with high affinity against a wide range of antigens and having no or minimum immunogenecity to human subjects treated with antibody therapeutics. This sequence represents a human peptide region of antibody relating to the novel antibody library construction method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and nucleic acids. The libraries constructed are useful as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches:

8 유 RESULT 15

ABO27112 standard; protein; 98 AA

ABO27112;

(first entry) 10-SEP-2003

Human germline heavy chain variable region gene segment #45.

Human; heavy chain variable region; VH; humanised antibody; chimeric antibody; complementarity determining region; CDR; canonical CDR structure type. 

Homo sapiens
